Tab 34  
Series on Low Paid

When analysed by age the numbers <sup>of younger men & women</sup> in different age groups who are disabled and are in employment is small, and we cannot say much about different degrees of disability. For those having any score on the index <sup>the earnings of men</sup> there was <sup>little for women</sup> a tendency to be lower relative to other men. However, more disabled men in the fifties and sixties had lower earnings. For example, 41% of men scoring 1-2 & 36% scoring 3+, compared with 28% and fewer with relatively higher earnings. <sup>more disabled than other</sup> <sup>men</sup> women tended to have low earnings, at all ages.

Source of men aged 50-59 21% scoring 1-2 & 23% 3+ were under 60% of mean earnings last week, compared 12% those scoring 0 and 5% & 7% respectively were under over 140% of mean, compared 12%.
