While there are

A careful work record was compiled for everyone working at least one week. While there were few non-incapacitated men in their ^{thirties} thirties, forties & fifties who were not employed the numbers begin to fall in the early sixties and fall steeply after 65. Nonetheless we estimate from the sample that there ^{were} 108,000

men ^{aged 30-64} not employed during the previous 12 months who were not incapacitated even to a minor extent. Although there must have been others in the teens & twenties ^{who were not employed} some of the numbers are were school or college students ^{men under 65} ~~that were also others who might be added.~~

There were also an estimated 72,000 ^{with minor incapacity} who were not employed as well as 360,000 with some or appreciable incapacity who were not employed.

On the other hand some ^{employed} have considerable incapacity in the sample. A small proportion of the sample, representing 279,000 of the ~~total~~ total population had appreciable or severe incapacity.

However there were an estimated 4 1/2 m women without incapacity under 60 who were not employed; 711,000 more with 1-2 and 720,000 3+.

There were 162,000 aged under 60 who were employed aged
